#### 17.3.9 Publication of SDG reports - SDG 9: Industry, Innovation and Infrastructure

Universitas Sriwijaya has made significant strides in ensuring clean and safe drinking water for its community. Through their innovative efforts, they have successfully produced treated drinking water known as “Rayyan Jadiid.” This water undergoes a meticulous purification process utilizing a state-of-the-art fibre filter system, which guarantees the removal of contaminants and impurities, making it suitable for consumption. Despite receiving an official permit from the competent authorities in Indonesia, specifically the Food and Drug Supervisory Agency, it is noteworthy that “Rayyan Jadiid” is currently being distributed internally without any cost to the consumers, emphasizing the university's commitment to providing access to clean water without financial barriers.

The implementation of the fibre filter system underscores Universitas Sriwijaya's dedication to promoting public health and well-being. By producing high-quality treated drinking water, the university has taken a proactive approach in addressing the pressing issue of clean water scarcity. Furthermore, their decision to distribute “Rayyan Jadiid” internally for free reflects a strong sense of social responsibility, ensuring that the benefits of their innovative solution reach those in need within the community. This initiative not only showcases the university's technical expertise but also highlights their compassion and commitment to fostering a healthier living environment for all.
